SECTION 262200 – LOW VOLTAGE DRY TYPE TRANSFORMERS

1.0 The transformers shall meet the applicable requirements of NEMA ST-20 and ANSI/IEEE C57.12.01 and C57.12.91, and shall be listed and labeled for conformance to UL 1561.

2.0 Dry type transformers shall comply with the most current mandated energy efficiency requirements, as a minimum. At the present time, the mandated energy efficiency requirements are those required by United States Department of Energy (DOE), as stipulated in 10 CFR, Part 431, applicable beginning January 1, 2016.

3.0 Transformer enclosures shall be formed, painted steel, NEMA 2 type for indoor applications, and NEMA 3R for indoor wet or outdoor applications. Provide permanent fungicidal treatment for coil and core for wet and outdoor applications.

4.0 Transformer cores shall be fabricated from electrical grade, non-aging silicon steel.

5.0 Transformer sound levels shall be a minimum of 3db lower than specified by NEMA ST 20, when tested according to IEEE C57.12.91.

6.0 Transformer windings shall be continuous wound copper without splices except for tap connections. Full capacity primary taps at +2.5% and +5% of nominal rated primary voltage shall be provided.

7.0 Transformers indicated for k-rating shall comply with UL 1561 requirements for nonsinusoidal load current handling capability to the degree defined by k-rating.

8.0 Transformers shall be sized for connected load with demand factors as allowed by NFPA 70. Transformer sizing shall also take into consideration planned future loads that may be placed on the transformer. Include thirty (30) percent spare capacity above the calculated demand load where the possibility for undefined future load addition exists.

9.0 Transformer insulation shall be rated for a total temperature of 220 degrees C, Class H, and the rated temperature rise shall not exceed 115 degrees C over a maximum ambient temperature of 40 degrees C. The design professional is responsible for coordinating the ventilation and cooling requirements for the transformer installation.

10.0 Provide vibration isolation and proper grounding for all transformers. Where required, seismic restraints shall be provided. Wall mounting of transformers shall be permitted only when manufacturer-supplied wall mounting brackets are utilized.
